

Free Domain & Web Hosting Deployment Playbook

Blue Ridge Stream Restoration & Mitigation LLC

Co-Founder & Managing Director: Hunter (Fly Fishing Georgia North Mountains)

Board Member: Hadi Irvani (General Partner at Infill Capital Partners, University of Virginia - UVA)

Strategic Advisor & Sponsor: Hill Hardman (Granite Holdings)

Ultimate KPI: Fund world-class fly fishing trip to Argentina!

This playbook walks you through registering a **free, high-quality .us.kg domain** using the **DigitalPlat FreeDomain** network, selecting the optimal short name for the business, and pushing the web assets (`index.html`, `portal.html`, `styles.css`, and images) to a free, premium hosting provider (like GitHub Pages or Vercel) bound to your custom domain.

■ Part 1: How to Register Your Free .us.kg Domain

DigitalPlat FreeDomain is a nonprofit registry sponsored by the Hack Foundation that allows individuals and organizations to claim free delegated subdomains (such as `.us.kg`) and configure them with custom nameservers.

Step 1: Claim Your Account & Complete GitHub KYC

1. **Register an Account:** Navigate to the DigitalPlat FreeDomain Dashboard:
■ [\[https://dash.domain.digitalplat.org/auth/register\]](https://dash.domain.digitalplat.org/auth/register)(<https://dash.domain.digitalplat.org/auth/register>)
2. **Verify via GitHub:** To prevent domain abuse and automated bot registrations, DigitalPlat requires a quick GitHub account verification.
3. **Complete the KYC Issue (If required):** If prompted for manual verification:
 - Go to the official issue repository:
[\[https://github.com/DigitalPlatDev/FreeDomain-Issues\]](https://github.com/DigitalPlatDev/FreeDomain-Issues)(<https://github.com/DigitalPlatDev/FreeDomain-Issues>).
 - Open a new issue with the title format: `Request GitHub KYC - [your_github_username]`.
 - Once approved, your dashboard account will be fully unlocked.

Step 2: Choose Your Domain Name

In the dashboard, click **Register Domain**, type your desired name, and select the `.us.kg` extension from the dropdown.

■ Part 2: Proposing a "Nice Short Name" under .us.kg

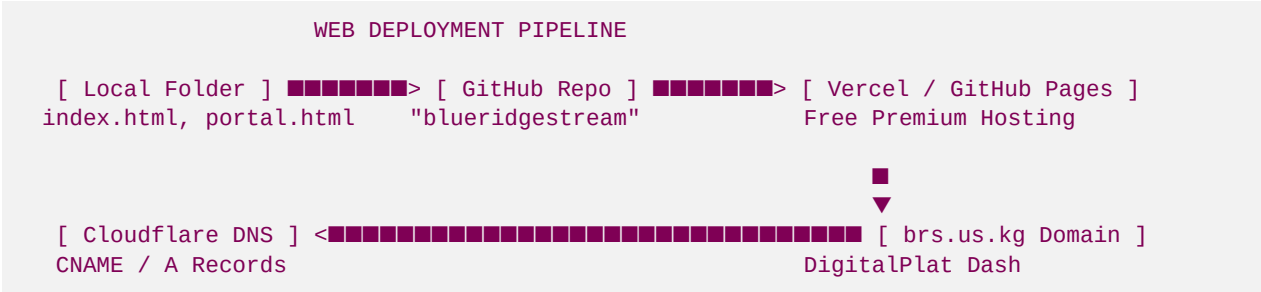

A short, memorable domain name looks highly professional on LinkedIn posts, business cards, and B2B emails. Here are the top proposed short names for Hunter's stream restoration business:

Domain Name	Business Alignment	Brand Value	Availability Tier
brs.us.kg	Blue Ridge Stream	★★★★★ (Shortest, highly B2B-friendly)	Premium Short
blueridge.us.kg	Blue Ridge Stream Restoration	★★★★★ (Full brand authority)	Standard Brand
trout.us.kg	Trout Streams	★★★★■ (Highlights the ecological niche)	Category Generic
ncd.us.kg	Natural Channel Design	★★★★■ (Positions as technical expert)	Technical Generic
creek.us.kg	Creek Restoration	★★★★■ (Subtle, organic mountain aesthetic)	Category Generic
mitigation.us.kg	Mitigation Banking	★★★★■ (Directly targets credit buyers)	Business Generic
restoration.us.kg	Stream Restoration	★★★★■ (High geographic authority)	Business Generic
acr.us.kg	Anderson Creek Restoration	★★★★■ (Specific to the flagship project)	Site Specific

■ **Recommendation:** First attempt to register **brs.us.kg** or **blueridge.us.kg** as they represent the highest brand value for B2B developer outreach.

■ Part 3: Deploying ("Pushing") the Site and Hosting it for Free

Once your domain (e.g., **brs.us.kg**) is registered, you need to point its DNS settings to a free, fast web host. We recommend using **Cloudflare** as the DNS manager, paired with either **GitHub Pages** or **Vercel** for hosting.

Method A: GitHub Pages (Easiest Native Deploy)

GitHub Pages hosts static HTML sites directly from a GitHub repository for free.

1. **Create a GitHub Repository:** Log in to GitHub and create a public repository named **blueridgestream**.
2. **Push Your Files:**
 - Initialize Git in your local folder:

```
git init
git add .
git commit -m "Initial launch of Blue Ridge Stream Restoration"
```

- Link to your GitHub repo and push:

```
git remote add origin https://github.com/[your_username]/blueridgestream.git
git branch -M main
git push -u origin main
```

3. Enable GitHub Pages:

- In your GitHub repository, go to **Settings > Pages** (in the sidebar).
- Under *Build and deployment*, set the Source to **Deploy from a branch**.
- Under *Branch*, select **main** and **/ (root)**, then click **Save**.

4. Bind Your Custom **.us.kg** Domain:

- In the GitHub Pages settings, scroll down to **Custom domain**.
- Type your registered domain: **brs.us.kg** and click **Save**.
- Check **Enforce HTTPS** to secure the connection.

Method B: Vercel (Highly Premium, One-Click Deploys)

Vercel is an elite hosting provider that integrates with GitHub, offering fast global content delivery network (CDN) speeds, beautiful previews, and automated SSL.

1. **Sign Up for Vercel:** Go to https://vercel.com and register for a free "Hobby" account using your GitHub login.
2. **Import Your Repo:**
 - In the Vercel dashboard, click **Add New > Project**.
 - Import your **blueridgestream** repository.
 - Keep the default settings and click **Deploy**. Vercel will deploy your site in under 30 seconds!
3. **Add Your Custom Domain:**
 - In your Vercel project, go to **Settings > Domains**.
 - Type your registered domain: **brs.us.kg** (or **www.brs.us.kg**) and click **Add**.
 - Vercel will display the exact DNS records (CNAME or A records) you need to add to your DNS manager.

■ ■ Part 4: Configuring DNS Settings (Cloudflare Integration)

To connect your DigitalPlat domain to Vercel or GitHub Pages, you must manage its DNS zone using **Cloudflare** (which is free and provides outstanding security and speed).

Step 1: Set Up Cloudflare

1. Sign up for a free account at https://dash.cloudflare.com.
2. Click **Add Site** and type your registered domain (e.g., **brs.us.kg**).
3. Select the **Free Plan** (\$0).

4. Cloudflare will scan your domain and provide you with **two Nameservers** (e.g., alisa.ns.cloudflare.com and ed.ns.cloudflare.com).

Step 2: Point Nameservers in DigitalPlat Dashboard

1. Log in to your [DigitalPlat FreeDomain Dashboard](<https://dash.domain.digitalplat.org/>).
2. Select your registered domain (brs.us.kg).
3. Change the Nameservers to the two custom nameservers provided by Cloudflare.
4. Wait 5–10 minutes for the DNS records to delegate.

Step 3: Add Host records in Cloudflare

Once Cloudflare is active, go to the **DNS** tab in your Cloudflare dashboard and add the appropriate records based on your hosting choice:

1. If Using GitHub Pages:

- **CNAME Record:**
 - Type: **CNAME**
 - Name: **@** (root)
 - Target: [\[your_github_username\].github.io](https://[your_github_username].github.io)
 - Proxy Status: DNS Only (Grey Cloud - recommended for initial custom domain verification).
- **Alternative (A Records):** Point to GitHub's official Pages IPs:
 - A Record -> **@** -> 185.199.108.153
 - A Record -> **@** -> 185.199.109.153
 - A Record -> **@** -> 185.199.110.153
 - A Record -> **@** -> 185.199.111.153

2. If Using Vercel:

- **A Record** (For root domain, e.g., brs.us.kg):
 - Type: **A**
 - Name: **@**
 - IPv4 Address: 76.76.21.21 (Vercel's global IP)
 - Proxy Status: DNS Only / Proxied
- **CNAME Record** (For subdomain, e.g., www.brs.us.kg):
 - Type: **CNAME**
 - Name: **www**
 - Target: cname.vercel-dns.com

■ Part 5: Launching Your Portals!

Once DNS propagation is complete (typically under 1 hour), Hunter's business is officially live on the internet!

- **Public Site:** Anyone typing <http://brs.us.kg> will see the beautiful, responsive B2C marketing landing page, establishing professional credibility for Mike Irby, Jeff Fuqua, or local trout estate owners.

- **Private Operations Portal:** Hunter can access his highly confidential operational databases, CRM, and real-time USACE SOP calculator by typing <http://brs.us.kg/portal.html> in his browser from any computer, securely powered by his own domain!
